Subject: ADVANCE PYTHON

# **Python Tkinter**

## **Topics Covered**

1. Python Tkinter	11. Tkinter Message
2. Tkinter Button	12. Tkinter Radio button
3. Tkinter Canvas	13. Tkinter Scale
4. Tkinter Check button	14. Tkinter Scrollbar
5. Tkinter Entry	15. Tkinter Text
6. Tkinter Frame	16. Tkinter Top-level
7. Tkinter Label	17. Tkinter Spin box
8. Tkinter List box	18. Tkinter Paned Window
9. Tkinter Menu button	19. Tkinter Label Frame
10. Tkinter Menu	20. Tkinter Message Box

### **Introduction:**

- Python offers multiple options for developing GUI (Graphical User Interface).
- Out of all the GUI methods, Tkinter is the most commonly used method.
- It is a standard Python interface to the Tk GUI toolkit shipped with Python.
- Python with Tkinter is the fastest and easiest way to create the GUI applications. Creating a GUI using Tkinter is an easy task.
- Most of you write a code and run it in a command-line terminal or an IDE (Integrated Development Environment), and the code produces an output based on what you expect out of it either on the terminal or on the IDE itself.
- However, what if you want your system to have a fancy looking user-interface or maybe your application (use-case) requires you to have a GUI.

#### What is GUI?

- GUI is nothing but a desktop app that provides you with an interface that helps you to interact with the computers and enriches your experience of giving a command (command-line input) to your code.
- They are used to perform different tasks in desktops, laptops, and other electronic devices, etc.

### > Some of the applications where the power of GUI is utilized are:

- Creating a Calculator which would have a user-interface and functionalities that persists in a calculator.
- Text-Editors, IDE's for coding are on a GUI app.
- Sudoku, Chess, Solitaire, etc.., are games that you can play are GUI apps.
- Chrome, Firefox, Microsoft Edge, etc. used to surf the internet is a GUI app.
- Another interesting use-case would be A GUI for controlling a Drone from your laptop, and the GUI would probably have buttons to maneuver the Drone along with a screen that would show the camera feed captured by the Drone in a real-time.

Page **1** of **2** 

### **Let's see some of the frameworks that Python provides to develop a GUI:**

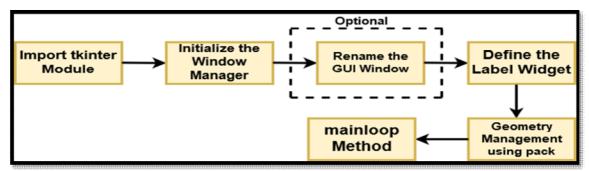

- **PyQT**: is one of the favored cross-platform Python bindings implementing the Qt library for the Qt application development framework. currently; PyQT is available for almost all operating systems like Unix/Linux, Windows, Mac OS X.
- **Kivy** is for the creation of new user interfaces and is an OpenGL ES 2 accelerated framework. Much like PyQt, Kivy also supports almost all platforms like Windows, Mac OSX, Linux, Android, iOS. It is an open-source framework and comes with over 20 pre-loaded widgets in its toolkit.
- **Jython** is a Python port for Java, which gives Python scripts seamless access to Java class libraries on the local machine.
- **WxPython**, initially known as WxWindows (now as a WxWidgets library), is an opensource abstract-level wrapper for cross-platform GUI library. It is implemented as a Python expansion module. With WxPython, you, as a developer, can create native applications for Windows, Mac OS, and UNIX.
- And finally, the framework that is the discussion in our whole chapter is Tkinter!
- **Tkinter** commonly comes bundled with Python, using Tk and is Python's standard GUI framework. It is famous for its simplicity and graphical user interface. It is open-source and available under the Python License.

**Note**: Tkinter comes pre-installed with Python3, and you need not bother about installing it.

### What is the Tkinter?:

Subject: ADVANCE PYTHON

- Tkinter is the standard GUI library for Python.
- Python when combined with Tkinter provides a fast and easy way to create GUI applications.
- The name Tkinter comes from Tk interface.
- Tkinter was written by Fredrik Lundh.
- Tkinter provides a powerful object-oriented interface to the Tk GUI toolkit. And Python is de facto standard GUI.
- Tkinter is included with standard Linux, Microsoft Windows and Mac OS installs of Python and Tkinter is free software released under a Python license.
- Now, let's build a very simple GUI with the help of Tkinter and understand it with the help of a flow diagram.

## Flow Diagram for Rendering a Basic GUI

- Let's break down the above flow diagram and understand what each component is handling!
- First, you import the key component, i.e., the Tkinter module.

- Subject: ADVANCE PYTHON
  - As a next step, you initialize the window manager with the tkinter.Tk () method and assign it to a variable.
  - This method creates a blank window with close, maximize, and minimize buttons on the top as a usual GUI should have.
  - Then as an optional step, you will rename the title of the window as you like with window.title (title\_of\_the\_window).
  - Next, you make use of a widget called Label, which is used to insert some text into the window.
  - Then, you make use of Tkinter's geometry management attribute called pack () to display the widget in size it requires.
  - Finally, as the last step, you use the mainloop () method to display the window until you manually close it. It runs an infinite loop in the backend.
  - Creating a GUI application using Tkinter is an easy task.
  - All you need to do is perform the following steps –
  - 1. Import the Tkinter module.
  - 2. Create the GUI application main window (Container).
  - 3. Add one or more of the above-mentioned widgets to the GUI application.
  - 4. Enter the main event loop to take action against each event triggered by the user.
  - Importing Tkinter is same as importing any other module in the Python code. **Note:** that the name of the module in Python 2.x is 'Tkinter' and in Python 3.x it is 'tkinter'.

## Import library as →import tkinter

- There are two main methods used which the user needs to remember while creating the Python application with GUI.
- 1. Tk(screenName=None, baseName=None, className='Tk', useTk=1):
- To create a main window, tkinter offers a method 'Tk(screenName=None, baseName=None, className='Tk', useTk=1)'.
- To change the name of the window, you can change the className to the desired one.
- The basic code used to create the main window of the application is:
   m=tkinter.Tk() where m is the name of the main window object

### 2. Mainloop ():

- There is a method known by the name mainloop () is used when your application is ready to run.
- Mainloop () is an infinite loop used to run the application, wait for an event to occur
  and process the event as long as the window is not closed.

m.mainloop ()

### **Example:**

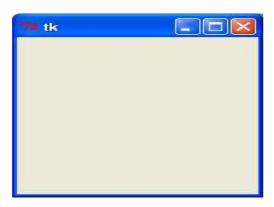

import tkinter
m = tkinter.Tk()
""

Widgets are added here

m.mainloop()

Page 3 of 3

• This would create a following window:

## **Tkinter widgets:**

• There are various widgets like button, canvas, checkbutton, entry, etc. that are used to build the python GUI applications.

SN	Widget	Description
1	Button	The Button is used to add various kinds of buttons to the
		python application.
2	Canvas	The canvas widget is used to draw the canvas on the
		window.
3	Checkbutton	The Checkbutton is used to display the CheckButton on the
		window.
4	Entry	The entry widget is used to display the single-line text field
		to the user. It is commonly used to accept user values.
5	Frame	It can be defined as a container to which, another widget
		can be added and organized.
6	Label	A label is a text used to display some message or
		information about the other widgets.
7	ListBox	The ListBox widget is used to display a list of options to
		the user.
8	Menubutton	The Menubutton is used to display the menu items to the
		user.
9	Menu	It is used to add menu items to the user.
10	Message	The Message widget is used to display the message-box to
		the user.
11	Radiobutton	The Radiobutton is different from a checkbutton. Here, the
		user is provided with various options and the user can
		select only one option among them.
12	Scale	It is used to provide the slider to the user.
13	Scrollbar	It provides the scrollbar to the user so that the user can
		scroll the window up and down.
14	Text	It is different from Entry because it provides a multi-line
		text field to the user so that the user can write the text and
		edit the text inside it.
14	Toplevel	It is used to create a separate window container.
15	Spinbox	It is an entry widget used to select from options of values.

16	PanedWindow	It is like a container widget that contains horizontal or
		vertical panes.
17	LabelFrame	A LabelFrame is a container widget that acts as the
		container
18	MessageBox	This module is used to display the message-box in the
	_	desktop based applications.

### **Python Tkinter Geometry:**

- The Tkinter geometry specifies the method by using which, the widgets are represented on display.
- The python Tkinter provides the following geometry methods.
- 1. The pack() method
- 2. The grid() method
- 3. The place() method

## 1. Python Tkinter pack() method:

- The pack() widget is used to organize widget in the block.
- The positions widgets added to the python application using the pack() method can be controlled by using the various options specified in the method call.
- However, the controls are less and widgets are generally added in the less organized manner.

## **Syntax:**

widget.pack(options)

- A list of possible options that can be passed in pack() is given below.
- 1. expand:
- If the expand is set to true, the widget expands to fill any space.
- 2. Fill:
- By default, the fill is set to NONE. However, we can set it to X or Y to determine whether the widget contains any extra space.
- 3. side:
- It represents the side of the parent to which the widget is to be placed on the window.

```
from tkinter import *
parent = Tk()
redbutton = Button(parent, text = "Red", fg = "red")
redbutton.pack( side = LEFT)
blackbutton = Button(parent, text = "Black", fg = "black")
blackbutton.pack( side = RIGHT )
bluebutton = Button(parent, text = "Blue", fg = "blue")
bluebutton.pack( side = TOP )
greenbutton = Button(parent, text = "Green", fg = "green")
greenbutton.pack( side = BOTTOM)
parent.mainloop()
```

### **Output:**

### 2. Python Tkinter grid() method:

- The grid() geometry manager organizes the widgets in the tabular form.
- We can specify the rows and columns as the options in the method call.
- We can also specify the column span (width) or rowspan(height) of a widget.
- This is a more organized way to place the widgets to the python application.

### **Syntax:**

widget.grid(options)

• A list of possible options that can be passed inside the grid() method is given below.

#### 1. Column:

- The column number in which the widget is to be placed.
- The leftmost column is represented by 0.

### 2. Columnspan:

- The width of the widget.
- It represents the number of columns up to which, the column is expanded.

#### 3. ipadx,ipady:

• It represents the number of pixels to pad the widget inside the widget's border.

### 4. padx,pady:

• It represents the number of pixels to pad the widget outside the widget's border.

#### 5 row

• The row number in which the widget is to be placed. The topmost row is represented by 0.

#### 6. rowspan:

• The height of the widget, i.e. the number of the row up to which the widget is expanded.

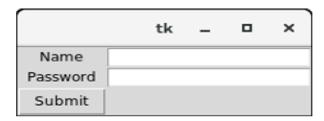

### 7. Sticky:

- If the cell is larger than a widget, then sticky is used to specify the position of the widget inside the cell.
- It may be the concatenation of the sticky letters representing the position of the widget.
- It may be N, E, W, S, NE, NW, NS, EW, ES.

```
from tkinter import *
parent = Tk()
name = Label(parent,text = "Name").grid(row = 0, column = 0)
e1 = Entry(parent).grid(row = 0, column = 1)
password = Label(parent,text = "Password").grid(row = 1, column = 0)
```

```
e2 = Entry(parent).grid(row = 1, column = 1)
submit = Button(parent, text = "Submit").grid(row = 4, column = 0)
parent.mainloop()
```

### **Output:**

## 3. Python Tkinter place() method:

• The place() geometry manager organizes the widgets to the specific x and y coordinates.

#### **Syntax:**

widget.place(options)

• A list of possible options is given below.

### 1. Anchor:

- It represents the exact position of the widget within the container.
- The default value (direction) is NW (the upper left corner)

#### 2. bordermode:

- The default value of the border type is INSIDE that refers to ignore the parent's inside the border.
- The other option is OUTSIDE.

#### 3. height, width:

• It refers to the height and width in pixels.

## 4. relheight, relwidth:

• It is represented as the float between 0.0 and 1.0 indicating the fraction of the parent's height and width.

#### 5. relx, rely:

• It is represented as the float between 0.0 and 1.0 that is the offset in the horizontal and vertical direction.

## 6. x, y:

• It refers to the horizontal and vertical offset in the pixels.

```
from tkinter import *
top = Tk()
top.geometry("400x250")
name = Label(top, text = "Name").place(x = 30,y = 50)
email = Label(top, text = "Email").place(x = 30, y = 90)
password = Label(top, text = "Password").place(x = 30, y = 130)
e1 = Entry(top).place(x = 80, y = 50)
```

e2 = Entry(top).place(x = 80, y = 90) e3 = Entry(top).place(x = 95, y = 130) top.mainloop()

## **Output:**

### 1. Tkinter Button:

- The button widget is used to add various types of buttons to the python application.
- Python allows us to configure the look of the button according to our requirements.
- Various options can be set or reset depending upon the requirements.
- We can also associate a method or function with a button which is called when the button is pressed.

## **Syntax:**

w = Button(parent, options)

SN	Option	Description
1	activebackground	It represents the background of the button when the
		mouse hover the button.
2	activeforeground	It represents the font color of the button when the mouse
		hover the button.
3	Bd	It represents the border width in pixels.
4	Bg	It represents the background color of the button.
5	Command	It is set to the function call which is scheduled when the
		function is called.
6	Fg	Foreground color of the button.
7	Font	The font of the button text.
8	Height	The height of the button. The height is represented in the
		number of text lines for the textual lines or the number
		of pixels for the images.

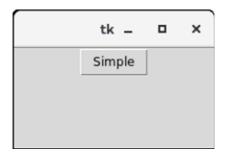

10	Highlightcolor	The color of the highlight when the button has the focus.
11	Image	It is set to the image displayed on the button.
12	justify	It illustrates the way by which the multiple text lines are
		represented. It is set to LEFT for left justification,
		RIGHT for the right justification, and CENTER for the
		center.
13	Padx	Additional padding to the button in the horizontal
		direction.
14	pady	Additional padding to the button in the vertical
		direction.
15	Relief	It represents the type of the border. It can be SUNKEN,
		RAISED, GROOVE, and RIDGE.
17	State	This option is set to DISABLED to make the button
		unresponsive. The ACTIVE represents the active state
		of the button.
18	Underline	Set this option to make the button text underlined.
19	Width	The width of the button. It exists as a number of letters
		for textual buttons or pixels for image buttons.
20	Wraplength	If the value is set to a positive number, the text lines will
		be wrapped to fit within this length.

## **Example:**

#python application to create a simple button

```
from tkinter import *
top = Tk()
top.geometry("200x100")
b = Button(top,text = "Simple")
b.pack()
top.mainaloop()
```

## **Output:**

## Example:

from tkinter import \*
top = Tk()
top.geometry("200x100")
def fun():
 messagebox.showinfo("Hello", "Red Button clicked")

```
b1 = Button(top,text = "Red",command = fun,activeforeground = "red",activebackground = "pink",pady=10)
```

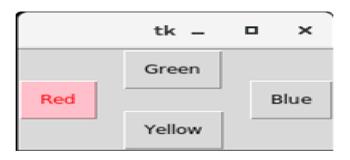

```
b2 = Button(top, text = "Blue",activeforeground = "blue",activebackground = "pink",pady =10)
```

b1.pack(side = LEFT) b2.pack(side = RIGHT) b3.pack(side = TOP)

b4.pack(side = BOTTOM)

top.mainloop()

## **Output:**

## 2. Tkinter Canvas

- The canvas widget is used to add the structured graphics to the python application.
- It is used to draw the graph and plots to the python application.

### **Syntax:**

w = canvas (parent, options)

It represents the type of the border. The possible values

It represents the coordinates specified as the tuple

If it is set to a positive value. The canvas is placed only

If the canvas is scrollable, this attribute should be the

Subject: ADVANCE PYTHON

from tkinter import \*
top = Tk()
top.geometry("200x200")
#creating a simple canvas
c = Canvas(top,bg = "pink",height = "200")
c.pack()
top.mainloop()

movement.

### **Output:**

## **Example: Creating an arc**

```
from tkinter import *
```

top = Tk()

top.geometry("200x200")

#creating a simple canvas

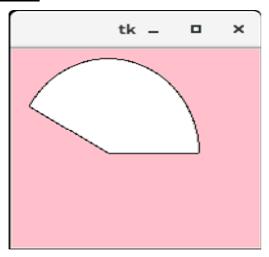

c = Canvas(top,bg = "pink",height = "200",width = 200)

 $arc = c.create\_arc((5,10,150,200),start = 0,extent = 150, fill= "white")$ 

c.pack()

top.mainloop()

### **Output:**

### 3. Tkinter Checkbutton:

- The Checkbutton is used to track the user's choices provided to the application.
- In other words, we can say that Checkbutton is used to implement the on/off selections.
- The Checkbutton can contain the text or images.
- The Checkbutton is mostly used to provide many choices to the user among which, the user needs to choose the one.
- It generally implements many of many selections.

#### **Syntax:**

w = checkbutton(master, options)

SN	Option	Description
1	activebackground	It represents the background color when the checkbutton
		is under the cursor.
2	activeforeground	It represents the foreground color of the checkbutton
		when the checkbutton is under the cursor.
3	bg	The background color of the button.
4	bitmap	It displays an image (monochrome) on the button.
5	bd	The size of the border around the corner.
6	command	It is associated with a function to be called when the

7 cursor The mouse pointer will be changed to the cursor name when it is over the checkbutton.  8 disableforeground It is the color which is used to represent the text of a disabled checkbutton.  9 font It represents the font of the checkbutton.  10 fg The foreground color (text color) of the checkbutton.			-4-4
when it is over the checkbutton.			state of the checkbutton is changed.
8         disableforeground disabled checkbutton.           9         font         It represents the font of the checkbutton.           10         fg         The foreground color (text color) of the checkbutton.           11         height         It represents the height of the checkbutton (number of lines). The default height is 1.           12         highlightcolor         The color of the focus highlight when the checkbutton is under focus.           13         image         The image used to represent the checkbutton.           14         justify         This specifies the justification of the text if the text contains multiple lines.           15         offvalue         The associated control variable is set to 0 by default if the button is unchecked. We can change the state of an unchecked variable to some other one.           16         onvalue         The associated control variable is set to 1 by default if the button is checked. We can change the state of the checked variable to some other one.           17         padx         The horizontal padding of the checkbutton.           18         pady         The vertical padding of the checkbutton.           19         relief         The type of the border of the checkbutton. By default, it is set to FLAT.           20         selection         The color of the checkbutton when it is set. By default, it is red.           21         selectimage         The image	7	cursor	
disabled checkbutton.			
9         font         It represents the font of the checkbutton.           10         fg         The foreground color (text color) of the checkbutton.           11         height         It represents the height of the checkbutton (number of lines). The default height is 1.           12         highlightcolor         The color of the focus highlight when the checkbutton is under focus.           13         image         The image used to represent the checkbutton.           14         justify         This specifies the justification of the text if the text contains multiple lines.           15         offvalue         The associated control variable is set to 0 by default if the button is unchecked. We can change the state of an unchecked variable to some other one.           16         onvalue         The associated control variable is set to 1 by default if the button is checked. We can change the state of the checked variable to some other one.           17         padx         The horizontal padding of the checkbutton.           18         pady         The vertical padding of the checkbutton.           19         relief         The type of the border of the checkbutton.           19         relief         The color of the checkbutton when it is set. By default, it is set to FLAT.           20         selectimage         The image is shown on the checkbutton. By default, it is set to normal. We can change it to DISABLED to make the checkbutton is AC	8	disableforeground	-
10         fg         The foreground color (text color) of the checkbutton.           11         height         It represents the height of the checkbutton (number of lines). The default height is 1.           12         highlightcolor         The color of the focus highlight when the checkbutton is under focus.           13         image         The image used to represent the checkbutton.           14         justify         This specifies the justification of the text if the text contains multiple lines.           15         offvalue         The associated control variable is set to 0 by default if the button is unchecked. We can change the state of an unchecked variable to some other one.           16         onvalue         The associated control variable is set to 1 by default if the button is checked. We can change the state of the checked variable to some other one.           17         padx         The horizontal padding of the checkbutton.           18         pady         The vertical padding of the checkbutton.           19         relief         The type of the border of the checkbutton. By default, it is set to FLAT.           20         selectcolor         The color of the checkbutton when it is set. By default, it is red.           21         selectimage         The image is shown on the checkbutton. By default, it is set to normal. We can change it to DISABLED to make the checkbutton is ACTIVE when it is under focus.           24         underli			disabled checkbutton.
11       height       It represents the height of the checkbutton (number of lines). The default height is 1.         12       highlightcolor       The color of the focus highlight when the checkbutton is under focus.         13       image       The image used to represent the checkbutton.         14       justify       This specifies the justification of the text if the text contains multiple lines.         15       offvalue       The associated control variable is set to 0 by default if the button is unchecked. We can change the state of an unchecked variable to some other one.         16       onvalue       The associated control variable is set to 1 by default if the button is checked. We can change the state of the checked variable to some other one.         17       padx       The horizontal padding of the checkbutton         18       pady       The vertical padding of the checkbutton.         19       relief       The type of the border of the checkbutton. By default, it is set to FLAT.         20       selectcolor       The image is shown on the checkbutton when it is set.         21       selectimage       The image is shown on the checkbutton by default, it is set to normal. We can change it to DISABLED to make the checkbutton is ACTIVE when it is under focus.         24       underline       It represents the index of the character in the text which is to be underlined. The indexing starts with zero in the text.         25       variable	9	font	It represents the font of the checkbutton.
lines). The default height is 1.   12	10	fg	The foreground color (text color) of the checkbutton.

# **Methods:**

• The methods that can be called with the Checkbuttons are described in the following table.

SN	Method	Description
1	deselect()	It is called to turn off the checkbutton.
2	flash()	The checkbutton is flashed between the active and normal colors.
3	invoke()	This will invoke the method associated with the checkbutton.
4	select()	It is called to turn on the checkbutton.
5	toggle()	It is used to toggle between the different Checkbuttons.

## **Example:**

```
from tkinter import *
top = Tk()
top.geometry("200x200")
checkvar1 = IntVar()
checkvar2 = IntVar()
checkvar3 = IntVar()
```

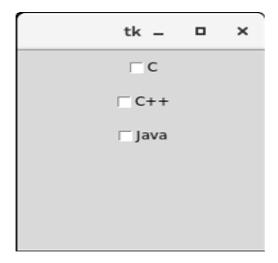

chkbtn1 = Checkbutton(top, text = "C", variable = checkvar1, onvalue = 1, offvalue = 0, h eight = 2, width = 10)

chkbtn2 = Checkbutton(top, text = "C++", variable = checkvar2, onvalue = 1, offvalue = 0, height = 2, width = 10)

chkbtn3 = Checkbutton(top, text = "Java", variable = checkvar3, onvalue = 1, offvalue = 0, height = 2, width = 10)

chkbtn1.pack()
chkbtn2.pack()
chkbtn3.pack()
top.mainloop()

## **Output:**

## 4. Tkinter Entry:

- The Entry widget is used to provide the single line text-box to the user to accept a value from the user.
- We can use the Entry widget to accept the text strings from the user.
- It can only be used for one line of text from the user.
- For multiple lines of text, we must use the text widget.

## **Syntax:**

 $\overline{w = Entry}$  (parent, options)

SN	Option	Description
1	bg	The background color of the widget.
2	bd	The border width of the widget in pixels.
3	cursor	The mouse pointer will be changed to the cursor type set to the arrow, dot, etc.
4	exportselection	The text written inside the entry box will be automatically copied to the clipboard by default. We can set the exportselection to 0 to not copy this.
5	fg	It represents the color of the text.
6	font	It represents the font type of the text.
7	highlightbackground	It represents the color to display in the traversal highlight region when the widget does not have the input focus.
8	highlightcolor	It represents the color to use for the traversal highlight rectangle that is drawn around the widget when it has the input focus.
9	highlightthickness	It represents a non-negative value indicating the width of the highlight rectangle to draw around the outside of the widget when it has the input focus.
10	insertbackground	It represents the color to use as background in the area covered by the insertion cursor. This color will normally override either the normal background for the widget.
11	insertborderwidth	It represents a non-negative value indicating the width of the 3-D border to draw around the insertion cursor. The value may have any of the forms acceptable to Tk_GetPixels.
12	insertofftime	It represents a non-negative integer value indicating the number of milliseconds the insertion cursor should remain "off" in each blink cycle. If this option is zero, then the cursor doesn't blink: it is on all the time.
13	insertontime	Specifies a non-negative integer value indicating the number of milliseconds the insertion cursor should remain "on" in each blink cycle.
14	insertwidth	It represents the value indicating the total width of the insertion cursor. The value may have any of the forms acceptable to Tk_GetPixels.
15	justify	It specifies how the text is organized if the text contains

		multiple lines
		multiple lines.
16	relief	It specifies the type of the border. Its default value is
		FLAT.
17	selectbackground	The background color of the selected text.
18	selectborderwidth	The width of the border to display around the selected
		task.
19	selectforeground	The font color of the selected task.
20	show	It is used to show the entry text of some other type instead
		of the string. For example, the password is typed using
		stars (*).
21	textvariable	It is set to the instance of the StringVar to retrieve the text
		from the entry.
22	width	The width of the displayed text or image.
23	xscrollcommand	The entry widget can be linked to the horizontal scrollbar
		if we want the user to enter more text then the actual width
		of the widget.

## Example:

```
from tkinter import *

top = Tk()

top.geometry("400x250")

name = Label(top, text = "Name").place(x = 30, y = 50)

email = Label(top, text = "Email").place(x = 30, y = 90)

password = Label(top, text = "Password").place(x = 30, y = 130)

submitbtn = Button(top, text = "Submit",activebackground = "pink", activeforeground = "blue").place(x = 30, y = 170)

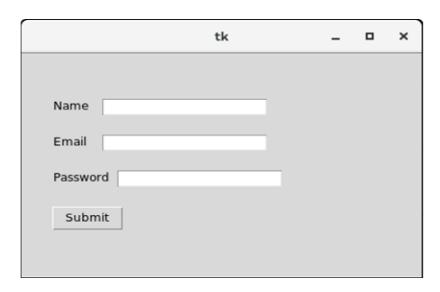

e1 = Entry(top).place(x = 80, y = 50)

e2 = Entry(top).place(x = 80, y = 90)

e3 = Entry(top).place(x = 95, y = 130)

top.mainloop()
```

## **Output:**

## **Entry widget methods:**

- Python provides various methods to configure the data written inside the widget.
- There are the following methods provided by the Entry widget.

SN	Method	Description
1	delete(first, last = none)	It is used to delete the specified characters inside
		the widget.
2	get()	It is used to get the text written inside the
		widget.
3	icursor(index)	It is used to change the insertion cursor position.
		We can specify the index of the character before
		which, the cursor to be placed.
4	index(index)	It is used to place the cursor to the left of the
		character written at the specified index.
5	insert(index,s)	It is used to insert the specified string before the
		character placed at the specified index.
6	select_adjust(index)	It includes the selection of the character present
		at the specified index.
7	select_clear()	It clears the selection if some selection has been
		done.
8	select_form(index)	It sets the anchor index position to the character
		specified by the index.
9	select_present()	It returns true if some text in the Entry is
		selected otherwise returns false.
10	select_range(start,end)	It selects the characters to exist between the
		specified range.
11	select_to(index)	It selects all the characters from the beginning to
		the specified index.
12	xview(index)	It is used to link the entry widget to a horizontal
		scrollbar.
13	xview_scroll(number,what)	It is used to make the entry scrollable
		horizontally.

## **Example:** A simple calculator

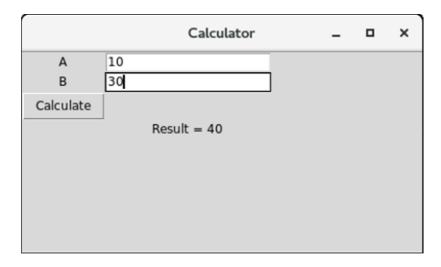

```
import tkinter as tk
from functools import partial
def call_result(label_result, n1, n2):
    num1 = (n1.get())
    num2 = (n2.get())
    result = int(num1)+int(num2)
    label_result.config(text="Result = %d" % result)
    return

root = tk.Tk()
root.geometry('400x200+100+200')
root.title('Calculator')
number1 = tk.StringVar()
number2 = tk.StringVar()
```

```
labelNum1 = tk.Label(root, text="A").grid(row=1, column=0)
labelNum2 = tk.Label(root, text="B").grid(row=2, column=0)
labelResult = tk.Label(root)
labelResult.grid(row=7, column=2)
entryNum1 = tk.Entry(root, textvariable=number1).grid(row=1, column=2)
entryNum2 = tk.Entry(root, textvariable=number2).grid(row=2, column=2)
call_result = partial(call_result, labelResult, number1, number2)
buttonCal = tk.Button(root, text="Calculate", command=call_result).grid(row=3, column=0)
```

root.mainloop()

### **Output:**

### 5. Tkinter Frame:

- Python Tkinter Frame widget is used to organize the group of widgets.
- It acts like a container which can be used to hold the other widgets.
- The rectangular areas of the screen are used to organize the widgets to the python application.

## **Syntax:**

w = Frame(parent, options)

SN	Option	Description
1	bd	It represents the border width.
2	bg	The background color of the widget.
3	cursor	The mouse pointer is changed to the cursor type set
		to different values like an arrow, dot, etc.
4	height	The height of the frame.
5	highlightbackground	The color of the background color when it is under
		focus.
6	highlightcolor	The text color when the widget is under focus.
7	highlightthickness	It specifies the thickness around the border when the

		widget is under the focus.
8	relief	It specifies the type of the border. The default value
		if FLAT.
9	width	It represents the width of the widget.

### **Example:**

```
from tkinter import *
```

top = Tk() top.geometry("140x100") frame = Frame(top) frame.pack()

leftframe = Frame(top)
leftframe.pack(side = LEFT)

rightframe = Frame(top) rightframe.pack(side = RIGHT)

btn1 = Button(frame, text="Submit", fg="red",activebackground = "red") btn1.pack(side = LEFT)

btn2 = Button(frame, text="Remove", fg="brown", activebackground = "brown") btn2.pack(side = RIGHT)

btn3 = Button(rightframe, text="Add", fg="blue", activebackground = "blue") btn3.pack(side = LEFT)

btn4 = Button(leftframe, text="Modify", fg="black", activebackground = "white") btn4.pack(side = RIGHT)

top.mainloop()

## **Output:**

## 6. Tkinter Label:

- The Label is used to specify the container box where we can place the text or images.
- This widget is used to provide the message to the user about other widgets used in the python application.
- There are the various options which can be specified to configure the text or the part of the text shown in the Label.

### **Syntax**:

 $\overline{w = Label}$  (master, options)

SN	Option	Description	
1	anchor	It specifies the exact position of the text within the size provided to the	
		widget. The default value is CENTER, which is used to center the text	
		within the specified space.	
2	bg	The background color displayed behind the widget.	
3	bitmap	It is used to set the bitmap to the graphical object specified so that, the	
		label can represent the graphics instead of text.	
4	bd	It represents the width of the border. The default is 2 pixels.	
5	cursor	The mouse pointer will be changed to the type of the cursor specified,	
		i.e., arrow, dot, etc.	
6	font	The font type of the text written inside the widget.	
7	fg	The foreground color of the text written inside the widget.	
8	height	The height of the widget.	
9	image	The image that is to be shown as the label.	
10	justify	It is used to represent the orientation of the text if the text contains	
		multiple lines. It can be set to LEFT for left justification, RIGHT for	
		right justification, and CENTER for center justification.	
11	padx	The horizontal padding of the text. The default value is 1.	
12	pady	The vertical padding of the text. The default value is 1.	
13	relief	The type of the border. The default value is FLAT.	
14	text	This is set to the string variable which may contain one or more line of	
		text.	
15	textvariable	The text written inside the widget is set to the control variable StringVar	
		so that it can be accessed and changed accordingly.	
16	underline	We can display a line under the specified letter of the text. Set this option	
		to the number of the letter under which the line will be displayed.	
17	width	The width of the widget. It is specified as the number of characters.	
18	wraplength	Instead of having only one line as the label text, we can break it to the	
		number of lines where each line has the number of characters specified to	
		this option.	

### **Example:**

```
from tkinter import * top = Tk() top.geometry("400x250") #creating label uname = Label(top, text = "Username").place(x = 30, y = 50) #creating label password = Label(top, text = "Password").place(x = 30, y = 90) submitbtn = Button(top, text = "Submit",activebackground = "pink", activeforeground = "blue").place(x = 30, y = 120) e1 = Entry(top,width = 20).place(x = 100, y = 50) e2 = Entry(top, width = 20).place(x = 100, y = 90) top.mainloop()
```

### **Output:**

## 7. Tkinter Listbox:

- The Listbox widget is used to display the list items to the user.
- We can place only text items in the Listbox and all text items contain the same font and color.
- The user can choose one or more items from the list depending upon the configuration.

#### **Syntax:**

w = Listbox(parent, options)

SN	Option	Description
1	bg	The background color of the widget.
2	bd	It represents the size of the border. Default value is 2
		pixel.
3	cursor	The mouse pointer will look like the cursor type like
		dot, arrow, etc.
4	font	The font type of the Listbox items.
5	fg	The color of the text.
6	height	It represents the count of the lines shown in the
		Listbox. The default value is 10.
7	highlightcolor	The color of the Listbox items when the widget is
		under focus.
8	highlightthickness	The thickness of the highlight.
9	relief	The type of the border. The default is SUNKEN.
10	selectbackground	The background color that is used to display the
		selected text.
11	selectmode	It is used to determine the number of items that can be
		selected from the list. It can set to BROWSE,
		SINGLE, MULTIPLE, EXTENDED.
12	width	It represents the width of the widget in characters.
13	xscrollcommand	It is used to let the user scroll the Listbox horizontally.
14	yscrollcommand	It is used to let the user scroll the Listbox vertically.

## **Methods:**

Subject: ADVANCE PYTHON

There are the following methods associated with the Listbox.

SN	Method	Description
1	activate(index)	It is used to select the lines at the specified index.
2	curselection()	It returns a tuple containing the line numbers of the selected
		element or elements, counting from 0. If nothing is selected,
		returns an empty tuple.
3	delete(first, last = None)	It is used to delete the lines which exist in the given range.
4	get(first, last = None)	It is used to get the list items that exist in the given range.
5	index(i)	It is used to place the line with the specified index at the top
		of the widget.
6	insert(index, *elements)	It is used to insert the new lines with the specified number
		of elements before the specified index.
7	nearest(y)	It returns the index of the nearest line to the y coordinate of
		the Listbox widget.
8	see(index)	It is used to adjust the position of the listbox to make the
		lines specified by the index visible.
9	size()	It returns the number of lines that are present in the Listbox
		widget.
10	xview()	This is used to make the widget horizontally scrollable.
11	xview_moveto(fraction)	It is used to make the listbox horizontally scrollable by the
		fraction of width of the longest line present in the listbox.

12	xview_scroll(number,	It is used to make the listbox horizontally scrollable by the
	what)	number of characters specified.
13	yview()	It allows the Listbox to be vertically scrollable.
14	<pre>yview_moveto(fraction)</pre>	It is used to make the listbox vertically scrollable by the
		fraction of width of the longest line present in the listbox.
15	yview_scroll (number,	It is used to make the listbox vertically scrollable by the
	what)	number of characters specified.

## Example 1:

from tkinter import \*

top = Tk()

top.geometry("200x250")

lbl = Label(top,text = "A list of favourite countries...")

listbox = Listbox(top)

listbox.insert(1,"India")

listbox.insert(2, "USA")

listbox.insert(3, "Japan")

listbox.insert(4, "Austrelia")

lbl.pack()

listbox.pack()

top.mainloop()

### **Output:**

## **Example 2: Deleting the active items from the list**

from tkinter import \*

top = Tk()

top.geometry("200x250")

lbl = Label(top,text = "A list of favourite countries...")

```
listbox = Listbox(top)
listbox.insert(1,"India")
listbox.insert(2, "USA")
listbox.insert(3, "Japan")
listbox.insert(4, "Austrelia")
```

#this button will delete the selected item from the list btn = Button(top, text = "delete", command = lambda listbox=listbox: listbox.delete(ANC HOR))

lbl.pack()
listbox.pack()
btn.pack()
top.mainloop()

### **Output:**

• After pressing the delete button.

#### 8. Tkinter Menubutton:

- The Menubutton widget can be defined as the drop-down menu that is shown to the user all the time.
- It is used to provide the user a option to select the appropriate choice exist within the application.
- The Menubutton is used to implement various types of menus in the python application.
- A Menu is associated with the Menubutton that can display the choices of the Menubutton when clicked by the user.

### **Syntax:**

w = Menubutton(Top, options)

A list of various options is given below.

SN	Option	Description
1	activebackground	The background color of the widget when the widget is under
		focus.
2	activeforeground	The font color of the widget text when the widget is under
		focus.
3	anchor	It specifies the exact position of the widget content when the
		widget is assigned more space than needed.
4	bg	It specifies the background color of the widget.
5	bitmap	It is set to the graphical content which is to be displayed to
		the widget.
6	bd	It represents the size of the border. The default value is 2
		pixels.
7	cursor	The mouse pointer will be changed to the cursor type
		specified when the widget is under the focus. The possible
		value of the cursor type is arrow, or dot etc.
8	direction	It direction can be specified so that menu can be displayed to
		the specified direction of the button. Use LEFT, RIGHT, or
		ABOVE to place the widget accordingly.
9	disabledforeground	The text color of the widget when the widget is disabled.
10	fg	The normal foreground color of the widget.
11	height	The vertical dimension of the Menubutton. It is specified as
		the number of lines.
12	highlightcolor	The highlight color shown to the widget under focus.
13	image	The image displayed on the widget.
14	justify	This specified the exact position of the text under the widget
		when the text is unable to fill the width of the widget. We can
		use the LEFT for the left justification, RIGHT for the right
		justification, CENTER for the centre justification.
15	menu	It represents the menu specified with the Menubutton.
16	padx	The horizontal padding of the widget.
17	pady	The vertical padding of the widget.
18	relief	This option specifies the type of the border. The default value
		is RAISED.

19	state	The normal state of the Mousebutton is enabled. We can set
		it to DISABLED to make it unresponsive.
20	text	The text shown with the widget.
21	textvariable	We can set the control variable of string type to the text variable so that we can control the text of the widget at runtime.
22	underline	The text of the widget is not underlined by default but we can set this option to make the text of the widget underlined.
23	width	It represents the width of the widget in characters. The default value is 20.
24	wraplength	We can break the text of the widget in the number of lines so that the text contains the number of lines not greater than the specified value.

## **Example:**

from tkinter import \*

```
top = Tk()
top.geometry("200x250")
menubutton = Menubutton(top, text = "Language", relief = FLAT)
menubutton.grid()
menubutton.menu = Menu(menubutton)
menubutton["menu"]=menubutton.menu
menubutton.menu.add_checkbutton(label = "Hindi", variable=IntVar())
menubutton.menu.add_checkbutton(label = "English", variable = IntVar())
```

menubutton.pack() top.mainloop()

## **Output:**

### 9. Tkinter Menu:

- The Menu widget is used to create various types of menus (top level, pull down, and pop up) in the python application.
- The top-level menus are the one which is displayed just under the title bar of the parent window.
- We need to create a new instance of the Menu widget and add various commands to it by using the add() method.

## **Syntax:**

w = Menu(top, options)

• A list of possible options is given below.

SN	Option	Description
1	activebackground	The background color of the widget when the widget is
		under the focus.
2	activeborderwidth	The width of the border of the widget when it is under the
		mouse. The default is 1 pixel.
3	activeforeground	The font color of the widget when the widget has the focus.
4	bg	The background color of the widget.
5	bd	The border width of the widget.
6	cursor	The mouse pointer is changed to the cursor type when it
		hovers the widget. The cursor type can be set to arrow or
		dot.
7	disabledforeground	The font color of the widget when it is disabled.
8	font	The font type of the text of the widget.
9	fg	The foreground color of the widget.
10	postcommand	The postcommand can be set to any of the function which is
		called when the mourse hovers the menu.
11	relief	The type of the border of the widget. The default type is
		RAISED.
12	image	It is used to display an image on the menu.
13	selectcolor	The color used to display the checkbutton or radiobutton
		when they are selected.
14	tearoff	By default, the choices in the menu start taking place from
		position 1. If we set the tearoff = 1, then it will start taking
		place from 0th position.
15	title	Set this option to the title of the window if you want to
		change the title of the window.

## **Methods**

• The Menu widget contains the following methods.

SN	Option	Description
1	add_command(options)	It is used to add the Menu items to the menu.
2	add_radiobutton(options)	This method adds the radiobutton to the menu.
3	add_checkbutton(options)	This method is used to add the checkbuttons to the
		menu.

4	add_cascade(options)	It is used to create a hierarchical menu to the parent
		menu by associating the given menu to the parent
		menu.
5	add_seperator()	It is used to add the seperator line to the menu.
6	add(type, options)	It is used to add the specific menu item to the
		menu.
7	delete(startindex,	It is used to delete the menu items exist in the
	endindex)	specified range.
8	entryconfig(index,	It is used to configure a menu item identified by
	options)	the given index.
9	index(item)	It is used to get the index of the specified menu
		item.
10	insert_seperator(index)	It is used to insert a seperator at the specified
	_	index.
11	invoke(index)	It is used to invoke the associated with the choice
		given at the specified index.
12	type(index)	It is used to get the type of the choice specified by
		the index.

## Creating a top level menu

• A top-level menu can be created by instantiating the Menu widget and adding the menu items to the menu.

## Example 1:

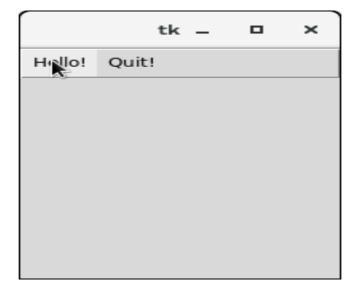

```
from tkinter import *

top = Tk()
def hello():
    print("hello!")

# create a toplevel menu
menubar = Menu(root)
menubar.add_command(label="Hello!", command=hello)
menubar.add_command(label="Quit!", command=top.quit)

# display the menu
top.config(menu=menubar)
top.mainloop()
```

## **Output:**

• Clicking the hello Menubutton will print the hello on the console while clicking the Quit Menubutton will make an exit from the python application.

### Example 2:

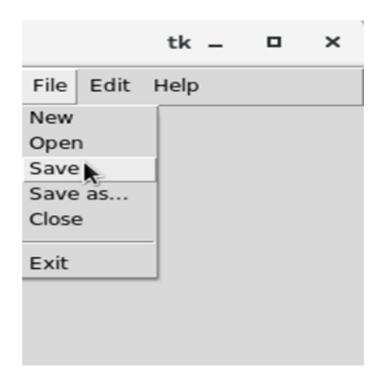

from tkinter import Toplevel, Button, Tk, Menu

```
top = Tk()
menubar = Menu(top)
file = Menu(menubar, tearoff=0)
file.add_command(label="New")
file.add_command(label="Open")
file.add_command(label="Save")
file.add_command(label="Save as...")
file.add_command(label="Close")
file.add_separator()
file.add_command(label="Exit", command=top.quit)
menubar.add_cascade(label="File", menu=file)
edit = Menu(menubar, tearoff=0)
edit.add_command(label="Undo")
edit.add_separator()
edit.add_command(label="Cut")
edit.add command(label="Copy")
edit.add_command(label="Paste")
edit.add_command(label="Delete")
edit.add_command(label="Select All")
```

```
menubar.add_cascade(label="Edit", menu=edit)
help = Menu(menubar, tearoff=0)
help.add_command(label="About")
menubar.add_cascade(label="Help", menu=help)
```

top.config(menu=menubar)
top.mainloop()

### **Output:**

### 10. Tkinter Message:

- The Message widget is used to show the message to the user regarding the behaviour of the python application.
- The message widget shows the text messages to the user which cannot be edited.
- The message text contains more than one line. However, the message can only be shown in the single font.

## **Syntax:**

w = Message(parent, options)

SN	Option	Description
1	anchor	It is used to decide the exact position of the text within the space
		provided to the widget if the widget contains more space than the
		need of the text. The default is CENTER.
2	bg	The background color of the widget.
3	bitmap	It is used to display the graphics on the widget. It can be set to any
		graphical or image object.
4	bd	It represents the size of the border in the pixel. The default size is 2

		pixel.	
5	cursor	The mouse pointer is changed to the specified cursor type. The	
		cursor type can be an arrow, dot, etc.	
6	font	The font type of the widget text.	
7	fg	The font color of the widget text.	
8	height	The vertical dimension of the message.	
9	image	We can set this option to a static image to show that onto the widget.	
10	justify	This option is used to specify the alignment of multiple line of code	
		with respect to each other. The possible values can be LEFT (left	
		alignment), CENTER (default), and RIGHT (right alignment).	
11	padx	The horizontal padding of the widget.	
12	pady	The vertical padding of the widget.	
13	relief	It represents the type of the border. The default type is FLAT.	
14	text	We can set this option to the string so that the widget can represent	
		the specified text.	
15	textvariable	This is used to control the text represented by the widget. The	
		textvariable can be set to the text that is shown in the widget.	
16	underline	The default value of this option is -1 that represents no underline.	
		We can set this option to an existing number to specify that nth letter	
		of the string will be underlined.	
17	width	It specifies the horizontal dimension of the widget in the number of	
		characters (not pixel).	
18	wraplength	We can wrap the text to the number of lines by setting this option to	
		the desired number so that each line contains only that number of	
		characters.	

## **Example:**

from tkinter import \*

top = Tk()

top.geometry("100x100")

var = StringVar()

msg = Message(top, text = "Welcome to Javatpoint")

msg.pack()
top.mainloop()

## **Output:**

application.

- 11. Tkinter Radiobutton:The Radiobutton widget is used to implement one-of-many selection in the python
- It shows multiple choices to the user out of which, the user can select only one out of them.
- We can associate different methods with each of the radiobutton.
- We can display the multiple line text or images on the radiobuttons.
- To keep track the user's selection the radiobutton, it is associated with a single variable.
- Each button displays a single value for that particular variable.

## **Syntax:**

w = Radiobutton(top, options)

SN	Option	Description
1	activebackground	The background color of the widget when it has the focus.
2	activeforeground	The font color of the widget text when it has the focus.
3	anchor	It represents the exact position of the text within the widget
		if the widget contains more space than the requirement of
		the text. The default value is CENTER.
4	bg	The background color of the widget.
5	bitmap	It is used to display the graphics on the widget. It can be set
		to any graphical or image object.
6	borderwidth	It represents the size of the border.
7	command	This option is set to the procedure which must be called
		every-time when the state of the radiobutton is changed.
8	cursor	The mouse pointer is changed to the specified cursor type.
		It can be set to the arrow, dot, etc.
9	font	It represents the font type of the widget text.
10	fg	The normal foreground color of the widget text.
11	height	The vertical dimension of the widget. It is specified as the
		number of lines (not pixel).
12	highlightcolor	It represents the color of the focus highlight when the
		widget has the focus.
13	highlightbackground	The color of the focus highlight when the widget is not
		having the focus.
14	image	It can be set to an image object if we want to display an
		image on the radiobutton instead the text.
15	justify	It represents the justification of the multi-line text. It can be
		set to CENTER(default), LEFT, or RIGHT.
16	padx	The horizontal padding of the widget.
17	pady	The vertical padding of the widget.
18	relief	The type of the border. The default value is FLAT.
19	selectcolor	The color of the radio button when it is selected.
20	selectimage	The image to be displayed on the radiobutton when it is
		selected.
21	state	It represents the state of the radio button. The default state
		of the Radiobutton is NORMAL. However, we can set this

		to DISABLED to make the radiobutton unresponsive.
22	text	The text to be displayed on the radiobutton.
23	textvariable	It is of String type that represents the text displayed by the
		widget.
24	underline	The default value of this option is -1, however, we can set
		this option to the number of character which is to be
		underlined.
25	value	The value of each radiobutton is assigned to the control
		variable when it is turned on by the user.
26	variable	It is the control variable which is used to keep track of the
		user's choices. It is shared among all the radiobuttons.
27	width	The horizontal dimension of the widget. It is represented as
		the number of characters.
28	wraplength	We can wrap the text to the number of lines by setting this
		option to the desired number so that each line contains only
		that number of characters.

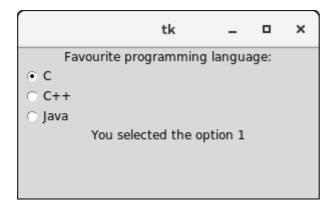

## **Methods:**

• The radiobutton widget provides the following methods.

SN	Method	Description
1	deselect()	It is used to turn of the radiobutton.
2	flash()	It is used to flash the radiobutton between its active and normal
		colors few times.
3	invoke()	It is used to call any procedure associated when the state of a
		Radiobutton is changed.
4	select()	It is used to select the radiobutton.

R3 = Radiobutton(top, text="Java", variable=radio, value=3, command=selection)
R3.pack( anchor = W)
label = Label(top)
label.pack()
top.mainloop()

### **Output:**

### 12. Tkinter Scale:

- The Scale widget is used to implement the graphical slider to the python application so that the user can slide through the range of values shown on the slider and select the one among them.
- We can control the minimum and maximum values along with the resolution of the scale.
- It provides an alternative to the Entry widget when the user is forced to select only one value from the given range of values.

### **Syntax:**

w = Scale(top, options)

SN	Option	Description
1	activebackground	The background color of the widget when it has the focus.
2	bg	The background color of the widget.
3	bd	The border size of the widget. The default is 2 pixel.
4	command	It is set to the procedure which is called each time when
		we move the slider. If the slider is moved rapidly, the
		callback is done when it settles.
5	cursor	The mouse pointer is changed to the cursor type assigned
		to this option. It can be an arrow, dot, etc.
6	digits	If the control variable used to control the scale data is of
		string type, this option is used to specify the number of
		digits when the numeric scale is converted to a string.
7	font	The font type of the widget text.

8	fg	The foreground color of the text.
9	from_	It is used to represent one end of the widget range.
10	highlightbackground	The highlight color when the widget doesn't have the
10	Inginginoackground	focus.
11	highlighcolor	The highlight color when the widget has the focus.
12	label	This can be set to some text which can be shown as a label
12	14001	with the scale. It is shown in the top left corner if the scale
		is horizontal or the top right corner if the scale is vertical.
13	length	It represents the length of the widget. It represents the X
13	iciigtii	dimension if the scale is horizontal or y dimension if the
		scale is vertical.
14	orient	It can be set to horizontal or vertical depending upon the
17	orient	type of the scale.
15	relief	It represents the type of the border. The default is FLAT.
16	repeatdelay	This option tells the duration up to which the button is to
10	repeatderay	be pressed before the slider starts moving in that direction
		repeatedly. The default is 300 ms.
17	resolution	It is set to the smallest change which is to be made to the
- /		scale value.
18	showvalue	The value of the scale is shown in the text form by default.
		We can set this option to 0 to suppress the label.
19	sliderlength	It represents the length of the slider window along the
		length of the scale. The default is 30 pixels. However, we
		can change it to the appropriate value.
20	state	The scale widget is active by default. We can set this to
		DISABLED to make it unresponsive.
21	takefocus	The focus cycles through the scale widgets by default. We
		can set this option to 0 if we don't want this to happen.
22	tickinterval	The scale values are displayed on the multiple of the
		specified tick interval. The default value of the tickinterval
		is 0.
23	to	It represents a float or integer value that specifies the other
		end of the range represented by the scale.
24	troughcolor	It represents the color of the through.
25	variable	It represents the control variable for the scale.
26	width	It represents the width of the through part of the widget.

# **Methods:**

Subject: ADVANCE PYTHON

SN	Method	Description
1	get()	It is used to get the current value of the scale.
2	set(value)	It is used to set the value of the scale.

### **Example:**

```
from tkinter import *

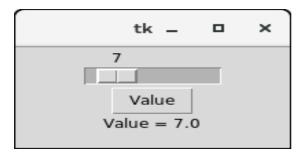

def select():
    sel = "Value = " + str(v.get())
    label.config(text = sel)

top = Tk()
top.geometry("200x100")
v = DoubleVar()
scale = Scale( top, variable = v, from_ = 1, to = 50, orient = HORIZONTAL)
scale.pack(anchor=CENTER)

btn = Button(top, text="Value", command=select)
btn.pack(anchor=CENTER)

label = Label(top)
label.pack()
top.mainloop()
```

### **Output:**

### 13. Tkinter Scrollbar:

- The scrollbar widget is used to scroll down the content of the other widgets like listbox, text, and canvas.
- However, we can also create the horizontal scrollbars to the Entry widget.

#### **Syntax:**

w = Scrollbar(top, options)

SN	Option	Description
1	activebackground	The background color of the widget when it has the
		focus.
2	bg	The background color of the widget.
3	bd	The border width of the widget.
4	command	It can be set to the procedure associated with the list which can be called each time when the scrollbar is moved.

	1	
5	cursor	The mouse pointer is changed to the cursor type set to
		this option which can be an arrow, dot, etc.
6	elementborderwidth	It represents the border width around the arrow heads
		and slider. The default value is -1.
7	Highlightbackground	The focus highlighcolor when the widget doesn't have
		the focus.
8	highlighcolor	The focus highlighcolor when the widget has the
		focus.
9	highlightthickness	It represents the thickness of the focus highlight.
10	jump	It is used to control the behavior of the scroll jump. If
		it set to 1, then the callback is called when the user
		releases the mouse button.
11	orient	It can be set to HORIZONTAL or VERTICAL
		depending upon the orientation of the scrollbar.
12	repeatdelay	This option tells the duration up to which the button is
		to be pressed before the slider starts moving in that
		direction repeatedly. The default is 300 ms.
13	repeatinterval	The default value of the repeat interval is 100.
14	takefocus	We can tab the focus through this widget by default.
		We can set this option to 0 if we don't want this
		behavior.
15	troughcolor	It represents the color of the trough.
16	width	It represents the width of the scrollbar.

• The widget provides the following methods.

SN	Method	Description	
1	get()	It returns the two numbers a and b which represents the current	
		position of the scrollbar.	
2	set(first,	It is used to connect the scrollbar to the other widget w. The	
	last)	yscrollcommand or xscrollcommand of the other widget to this	
		method.	

#### **Example:**

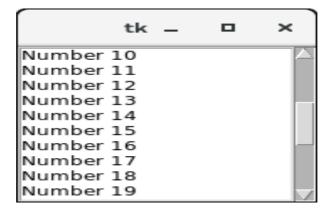

```
from tkinter import *

top = Tk()
sb = Scrollbar(top)
sb.pack(side = RIGHT, fill = Y)

mylist = Listbox(top, yscrollcommand = sb.set )
for line in range(30):
    mylist.insert(END, "Number " + str(line))
mylist.pack( side = LEFT )
sb.config( command = mylist.yview )

mainloop()
```

Subject: ADVANCE PYTHON

#### 14. Tkinter Text:

- The Text widget is used to show the text data on the Python application.
- However, Tkinter provides us the Entry widget which is used to implement the single line text box.
- The Text widget is used to display the multi-line formatted text with various styles and attributes.
- The Text widget is mostly used to provide the text editor to the user.
- The Text widget also facilitates us to use the marks and tabs to locate the specific sections of the Text.
- We can also use the windows and images with the Text as it can also be used to display the formatted text.

## **Syntax:**

w = Text(top, options)

• A list of possible options that can be used with the Text widget is given below.

SN	Option	Description
1	bg	The background color of the widget.
2	bd	It represents the border width of the widget.
3	cursor	The mouse pointer is changed to the specified cursor
		type, i.e. arrow, dot, etc.
4	exportselection	The selected text is exported to the selection in the
		window manager. We can set this to 0 if we don't want
		the text to be exported.
5	font	The font type of the text.
6	fg	The text color of the widget.
7	height	The vertical dimension of the widget in lines.
8	highlightbackground	The highlightcolor when the widget doesn't has the
		focus.
9	highlightthickness	The thickness of the focus highlight. The default value is
		1.
10	highlighcolor	The color of the focus highlight when the widget has the
		focus.

11	insertbackground	It represents the color of the insertion cursor.
12	insertborderwidth	It represents the width of the border around the cursor.
		The default is 0.
13	insertofftime	The time amount in Milliseconds during which the
		insertion cursor is off in the blink cycle.
14	insertontime	The time amount in Milliseconds during which the
		insertion cursor is on in the blink cycle.
15	insertwidth	It represents the width of the insertion cursor.
16	padx	The horizontal padding of the widget.
17	pady	The vertical padding of the widget.
18	relief	The type of the border. The default is SUNKEN.
19	selectbackground	The background color of the selected text.
20	selectborderwidth	The width of the border around the selected text.
21	spacing1	It specifies the amount of vertical space given above
		each line of the text. The default is 0.
22	spacing2	This option specifies how much extra vertical space to
		add between displayed lines of text when a logical line
		wraps. The default is 0.
23	spacing3	It specifies the amount of vertical space to insert below
		each line of the text.
24	state	It the state is set to DISABLED, the widget becomes
		unresponsive to the mouse and keyboard unresponsive.
25	tabs	This option controls how the tab character is used to
		position the text.
26	width	It represents the width of the widget in characters.
27	wrap	This option is used to wrap the wider lines into multiple
		lines. Set this option to the WORD to wrap the lines after
		the word that fit into the available space. The default
		value is CHAR which breaks the line which gets too
		wider at any character.
28	xscrollcommand	To make the Text widget horizontally scrollable, we can
		set this option to the set() method of Scrollbar widget.
29	yscrollcommand	To make the Text widget vertically scrollable, we can set
		this option to the set() method of Scrollbar widget.

• We can use the following methods with the Text widget.

SN	Method	Description
1	delete(startindex,	This method is used to delete the characters of the
	endindex)	specified range.
2	get(startindex,	It returns the characters present in the specified range.
	endindex)	
3	index(index)	It is used to get the absolute index of the specified index.
4	insert(index, string)	It is used to insert the specified string at the given index.
5	see(index)	It returns a boolean value true or false depending upon
		whether the text at the specified index is visible or not.

**Mark handling methods:** 

• Marks are used to bookmark the specified position between the characters of the associated text.

SN	Method	Description
1	index(mark)	It is used to get the index of the specified mark.
2	mark_gravity(mark, gravity)	It is used to get the gravity of the given mark.
3	mark_names()	It is used to get all the marks present in the Text widget.
4	mark_set(mark, index)	It is used to inform a new position of the given mark.
5	mark_unset(mark)	It is used to remove the given mark from the text.

#### Tag handling methods

- The tags are the names given to the separate areas of the text.
- The tags are used to configure the different areas of the text separately.
- The list of tag-handling methods along with the description is given below.

SN	Method	Description
1	tag_add(tagname, startindex,	This method is used to tag the string present in
	endindex)	the specified range.
2	tag_config	This method is used to configure the tag
		properties.
3	tag_delete(tagname)	This method is used to delete a given tag.
4	tag_remove(tagname,	This method is used to remove a tag from the
	startindex, endindex)	specified range.

#### **Example**

```
from tkinter import *

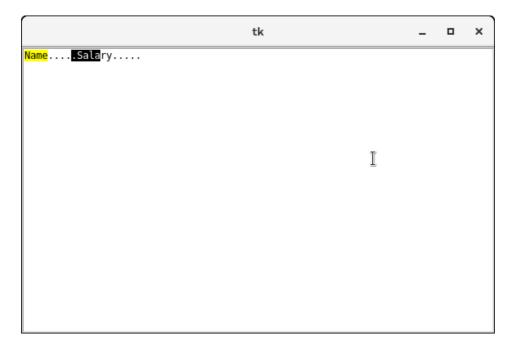

top = Tk()
text = Text(top)
text.insert(INSERT, "Name.....")
text.insert(END, "Salary.....")

text.pack()

text.tag_add("Write Here", "1.0", "1.4")
text.tag_add("Click Here", "1.8", "1.13")

text.tag_config("Write Here", background="yellow", foreground="black")
text.tag_config("Click Here", background="black", foreground="white")

top.mainloop()
```

#### 15. Tkinter Toplevel:

- The Toplevel widget is used to create and display the toplevel windows which are directly managed by the window manager.
- The toplevel widget may or may not have the parent window on the top of them.
- The toplevel widget is used when a python application needs to represent some extra information, pop-up, or the group of widgets on the new window.
- The toplevel windows have the title bars, borders, and other window decorations.

#### **Syntax:**

w = Toplevel(options)

• A List of possible options is given below.

SN	Options	Description
1	bg	It represents the background color of the window.
2	bd	It represents the border size of the window.
3	cursor	The mouse pointer is changed to the cursor type set to the arrow, dot,
		etc. when the mouse is in the window.
4	class_	The text selected in the text widget is exported to be selected to the
		window manager. We can set this to 0 to make this behavior false.
5	font	The font type of the text inserted into the widget.
6	fg	The foreground color of the widget.
7	height	It represents the height of the window.
8	relief	It represents the type of the window.
9	width	It represents the width of the window,

• The methods associated with the Toplevel widget is given in the following list.

SN	Method	Description
1	deiconify()	This method is used to display the window.
2	frame()	It is used to show a system dependent window identifier.
3	group(window)	It is used to add this window to the specified window
		group.
4	iconify()	It is used to convert the toplevel window into an icon.
5	protocol(name,	It is used to mention a function which will be called for
	function)	the specific protocol.
6	state()	It is used to get the current state of the window. Possible
		values are normal, iconic, withdrawn, and icon.
7	transient([master])	It is used to convert this window to a transient window
		(temporary).
8	withdraw()	It is used to delete the window but doesn't destroy it.
9	maxsize(width,	It is used to declare the maximum size for the window.
	height)	
10	minsize(width,	It is used to declare the minimum size for the window.
	height)	
11	positionfrom(who)	It is used to define the position controller.
12	resizable(width,	It is used to control whether the window can be resizable
	height)	or not.
13	sizefrom(who)	It is used to define the size controller.
14	title(string)	It is used to define the title for the window.

#### **Example:**

```
from tkinter import *

root = Tk()
root.geometry("200x200")
def open():
    top = Toplevel(root)
    top.mainloop()
btn = Button(root, text = "open", command = open)
btn.place(x=75,y=50)
root.mainloop()
```

## **Output:**

## 16. Tkinter Spinbox:

- The Spinbox widget is an alternative to the Entry widget.
- It provides the range of values to the user, out of which, the user can select the one.
- It is used in the case where a user is given some fixed number of values to choose from.
- We can use various options with the Spinbox to decorate the widget.

#### **Syntax:**

 $\overline{w} = \overline{Spinbox}$  (top, options)

• A list of possible options is given below.

SN	Option	Description
1	activebackground	The background color of the widget when it has the focus.
2	bg	The background color of the widget.
3	bd	The border width of the widget.
4	command	The associated callback with the widget which is called
5	cursor	each time the state of the widget is called.  The mouse pointer is changed to the cursor type assigned to this option.
6	disabledbackground	The background color of the widget when it is disabled.
7	disabledforeground	The foreground color of the widget when it is disabled.
8	fg	The normal foreground color of the widget.
9	font	The font type of the widget content.
10	format	This option is used for the format string. It has no default value.
11	from_	It is used to show the starting range of the widget.
12	justify	It is used to specify the justification of the multi-line widget content. The default is LEFT.
13	relief	It is used to specify the type of the border. The default is SUNKEN.
14	repeatdelay	This option is used to control the button auto repeat. The value is given in milliseconds.
15	repeatinterval	It is similar to repeatdelay. The value is given in milliseconds.
16	state	It represents the state of the widget. The default is NORMAL. The possible values are NORMAL, DISABLED, or "readonly".
17	textvariable	It is like a control variable which is used to control the behaviour of the widget text.
18	to	It specify the maximum limit of the widget value. The other is specified by the from_ option.
19	validate	This option controls how the widget value is validated.
20	validatecommand	It is associated to the function callback which is used for the validation of the widget content.
21	values	It represents the tuple containing the values for this widget.
22	vemd	It is same as validation command.
23	width	It represents the width of the widget.
24	wrap	This option wraps up the up and down button the Spinbox.
	<b></b>	This option whops up the up and down outton the spinook.

25	xscrollcommand	This options is set to the set() method of scrollbar to make
		this widget horizontally scrollable.

• There are the following methods associated with the widget.

SN	Option	Description
1	delete(startindex,	This method is used to delete the characters present at the
	endindex)	specified range.
2	get(startindex,	It is used to get the characters present in the specified
	endindex)	range.
3	identify(x, y)	It is used to identify the widget's element within the
		specified range.
4	index(index)	It is used to get the absolute value of the given index.
5	insert(index, string)	This method is used to insert the string at the specified
		index.
6	invoke(element)	It is used to invoke the callback associated with the
		widget.

## **Example:**

```
from tkinter import *
top = Tk()
top.geometry("200x200")
spin = Spinbox(top, from_= 0, to = 25)
spin.pack()
top.mainloop()
```

#### **Output:**

#### 17. Tkinter PanedWindow:

- The PanedWindow widget acts like a Container widget which contains one or more child widgets (panes) arranged horizontally or vertically.
- The child panes can be resized by the user, by moving the separator lines known as sashes by using the mouse.

- Subject: ADVANCE PYTHON
  - The PanedWindow is used to implement the different layouts in the python applications.

# **Syntax:**

 $\overline{\text{w= PanedWindow}}$ (master, options)

• A list of possible options is given below.

Each pane contains only one widget.

SN	Option	Description
1	bg	It represents the background color of the widget when it doesn't have the focus.
2	bd	It represents the 3D border size of the widget. The default option specifies that the trough contains no border whereas the arrowheads and slider contain the 2-pixel border size.
3	borderwidth	It represents the border width of the widget. The default is 2 pixel.
4	cursor	The mouse pointer is changed to the specified cursor type when it is over the window.
5	handlepad	This option represents the distance between the handle and the end of the sash. For the horizontal orientation, it is the distance between the top of the sash and the handle. The default is 8 pixels.
6	handlesize	It represents the size of the handle. The default size is 8 pixels. However, the handle will always be a square.
7	height	It represents the height of the widget. If we do not specify the height, it will be calculated by the height of the child window.
8	orient	The orient will be set to HORIZONTAL if we want to place the child windows side by side. It can be set to VERTICAL if we want to place the child windows from top to bottom.
9	relief	It represents the type of the border. The default is FLAT.
10	sashpad	It represents the padding to be done around each sash. The default is 0.
11	sashrelief	It represents the type of the border around each of the sash. The default is FLAT.
12	sashwidth	It represents the width of the sash. The default is 2 pixels.
13	showhandle	It is set to True to display the handles. The default value is false.
14	Width	It represents the width of the widget. If we don't specify the width of the widget, it will be calculated by the size of the child widgets.

## **Methods:**

• There are the following methods that are associated with the PanedWindow.

SN	Method	Description
1	add(child, options)	It is used to add a window to the parent window.
2	get(startindex, endindex)	This method is used to get the text present at the specified
		range.

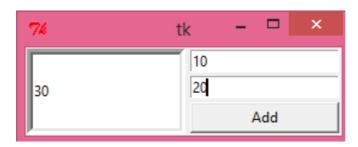

3 config(options)

It is used to configure the widget with the specified options.

#### **Example:**

```
from tkinter import *
def add():
  a = int(e1.get())
  b = int(e2.get())
  leftdata = str(a+b)
  left.insert(1,leftdata)
w1 = PanedWindow()
w1.pack(fill = BOTH, expand = 1)
left = Entry(w1, bd = 5)
w1.add(left)
w2 = PanedWindow(w1, orient = VERTICAL)
w1.add(w2)
e1 = Entry(w2)
e2 = Entry(w2)
w2.add(e1)
w2.add(e2)
bottom = Button(w2, text = "Add", command = add)
w2.add(bottom)
mainloop()
```

#### **Output:**

#### 18. Tkinter LabelFrame:

- The LabelFrame widget is used to draw a border around its child widgets.
- We can also display the title for the LabelFrame widget.
- It acts like a container which can be used to group the number of interrelated widgets such as Radiobuttons.
- This widget is a variant of the Frame widget which has all the features of a frame.
- It also can display a label.

#### **Syntax:**

w = LabelFrame(top, options)

• A list of options is given below.

SN	Option	Description
1	bg	The background color of the widget.
2	bd	It represents the size of the border shown around the indicator.
		The default is 2 pixels.
3	Class	The default value of the class is LabelFrame.
4	colormap	This option is used to specify which colomap is to be used for
		this widget. By colormap, we mean the 256 colors that are used
		to form the graphics. With this option, we can reuse the
		colormap of another window on this widget.
5	container	If this is set to true, the LabelFrame becomes the container
		widget. The default value is false.
6	cursor	It can be set to a cursor type, i.e. arrow, dot, etc. the mouse
		pointer is changed to the cursor type when it is over the widget.
7	fg	It represents the foreground color of the widget.
8	font	It represents the font type of the widget text.
9	height	It represents the height of the widget.
10	labelAnchor	It represents the exact position of the text within the widget. The
		default is NW(north-west)
11	labelwidget	It represents the widget to be used for the label. The frame uses
		the text for the label if no value specified.
12	highlightbackground	The color of the focus highlight border when the widget doesn't
		have the focus.
13	highlightcolor	The color of the focus highlight when the widget has the focus.
14	highlightthickness	The width of the focus highlight border.
15	padx	The horizontal padding of the widget.
16	pady	The vertical padding of the widget.
17	relief	It represents the border style. The default value is GROOVE.
18	text	It represents the string containing the label text.
19	width	It represents the width of the frame.

# Example:

```
from tkinter import *
```

$$top = Tk()$$
  
top.geometry("300x200")

labelframe1 = LabelFrame(top, text="Positive Comments")
labelframe1.pack(fill="both", expand="yes")

toplabel = Label(labelframe1, text="Place to put the positive comments") toplabel.pack()

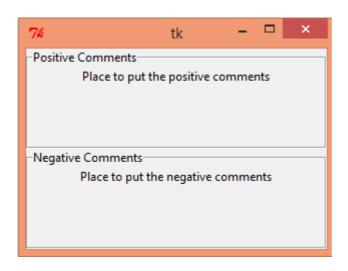

labelframe2 = LabelFrame(top, text = "Negative Comments")

labelframe2.pack(fill="both", expand = "yes")

bottomlabel = Label(labelframe2,text = "Place to put the negative comments") bottomlabel.pack()

top.mainloop()

#### **Output:**

#### 19. Tkinter messagebox:

- The messagebox module is used to display the message boxes in the python applications.
- There are the various functions which are used to display the relevant messages depending upon the application requirements.

#### **Syntax:**

messagebox.function\_name(title, message [, options])

#### **Parameters:**

- **1. function\_name:** It represents an appropriate message box function.
- 2. title: It is a string which is shown as a title of a message box.
- **3. message:** It is the string to be displayed as a message on the message box.
- **4. options:** There are various options which can be used to configure the message dialog box.
- The two options that can be used are default and parent.

#### 1. default:

 The default option is used to mention the types of the default button, i.e. ABORT, RETRY, or IGNORE in the message box.

#### 2. parent:

- The parent option specifies the parent window on top of which, the message box is to be displayed.
- There is one of the following functions used to show the appropriate message boxes.

- All the functions are used with the same syntax but have the specific functionalities.
- 1. showinfo():
- The showinfo() messagebox is used where we need to show some relevant information to the user.

## **Example:**

```
from tkinter import *

from tkinter import messagebox

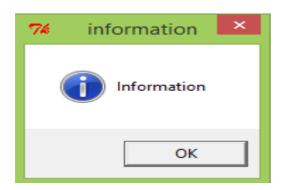

top = Tk()

top.geometry("100x100")
```

messagebox.showinfo("information", "Information")

top.mainloop()

#### **Output:**

## 2. showwarning():

• This method is used to display the warning to the user.

#### **Example:**

from tkinter import \*

from tkinter import messagebox

```
top = Tk()
top.geometry("100x100")
messagebox.showwarning("warning","Warning")
top.mainloop()
```

#### 3. showerror():

• This method is used to display the error message to the user.

#### **Example:**

from tkinter import \* from tkinter import messagebox

```
top = Tk()
top.geometry("100x100")
messagebox.showerror("error","Error")
top.mainloop()
```

## **Output:**

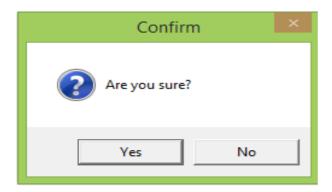

#### 4. askquestion():

 This method is used to ask some question to the user which can be answered in yes or no.

#### **Example:**

from tkinter import \* from tkinter import messagebox

```
top = Tk() \\ top.geometry("100x100") \\ messagebox.askquestion("Confirm", "Are you sure?") \\ top.mainloop()
```

#### 5. askokcancel()

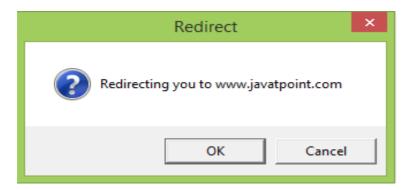

• This method is used to confirm the user's action regarding some application activity.

## **Example:**

from tkinter import \* from tkinter import messagebox

```
top = Tk() \\ top.geometry("100x100") \\ messagebox.askokcancel("Redirect","Redirecting you to www.javatpoint.com") \\ top.mainloop()
```

#### **Output:**

#### 6. askyesno():

• This method is used to ask the user about some action to which, the user can answer in yes or no.

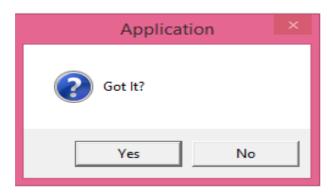

#### **Example:**

from tkinter import \* from tkinter import messagebox

```
top = Tk()
top.geometry("100x100")
messagebox.askyesno("Application","Got It?")
```

top.mainloop()

## **Output:**

## 7. askretrycancel():

• This method is used to ask the user about doing a particular task again or not.

#### **Example:**

from tkinter import \* from tkinter import messagebox

```
\begin{split} top &= Tk() \\ top.geometry("100x100") \\ messagebox.askretrycancel("Application","try again?") \end{split}
```

top.mainloop()

#### **Output:**
